PRESENTATION OUTLINE

PRESENTATION OUTLINE

2C Biomass Energy Recovery Optimization

- Demonstrated Invention – Algae to Biofuel
- Recognized Need
 - Why Algae?
 - Algae Process Challenges
- Process Description – Potential Solutions
- Benefit Compared to Existing Capabilities
- Proposed Path Forward

A background image featuring a bright sunburst or lens flare effect in the center, with rays of light extending outwards. The overall color palette is a gradient of blues, from a lighter, hazy blue in the center to a darker, more saturated blue at the top and bottom edges.

DEMONSTRATED INVENTION ALGAE TO BIOFUEL

A background image featuring a bright sunburst or starburst effect in the center, with rays of light radiating outwards. The background is a gradient of blue and teal colors, with a horizontal band of lighter blue across the middle.

RECOGNIZED NEED

Why Algae?

2C Biomass Energy Recovery Optimization

- Fastest growing biomass
- No adverse impact on
 - Environment
 - Food supplies
- Can grow using
 - Waste gas (CO₂)
 - Wastewater
 - Waste land
 - Waste energy

Why Algae?

2C Biomass Energy Recovery Optimization

- Highly efficient organism
- Can contain up to 60% lipids
- **Oil Yield (gal/ac)**
- Corn 18
- Cotton 35
- Soybean 48
- Jatropha 202
- Palm 635
- Algae (10 g/m²/d - 15% TAG) 1,200
- Algae (50 g/m²/d - 50% TAG) 10,000
- Source: NREL - <http://www.nrel.gov/docs/fy08osti/42414.pdf>

Why Algae?

2C Biomass Energy Recovery Optimization

- Biomass can be digested for methane
- Carbon-neutral energy source

Process Challenges

2C Biomass Energy Recovery Optimization

- Algae Growth
 - Must bring together
 - Light
 - CO₂
 - Nutrients
 - Water
 - Should have least footprint
- Oil extraction
 - Must be energy efficient
 - Should ideally use no chemicals

PROCESS DESCRIPTION

ALGAE PRODUCTION SYSTEM

2C Biomass Energy Recovery Optimization

OPTIMIZED ALGAE PRODUCTION SYSTEM

Quantum Fracturing
An ultra-efficient microbubble device to optimize distribution of CO₂ and nutrients throughout the algae culture.

Dynamic Control System
Biofeedback system that allows the algae to dictate the timing and volume of nutrients and other factors to optimize growth.

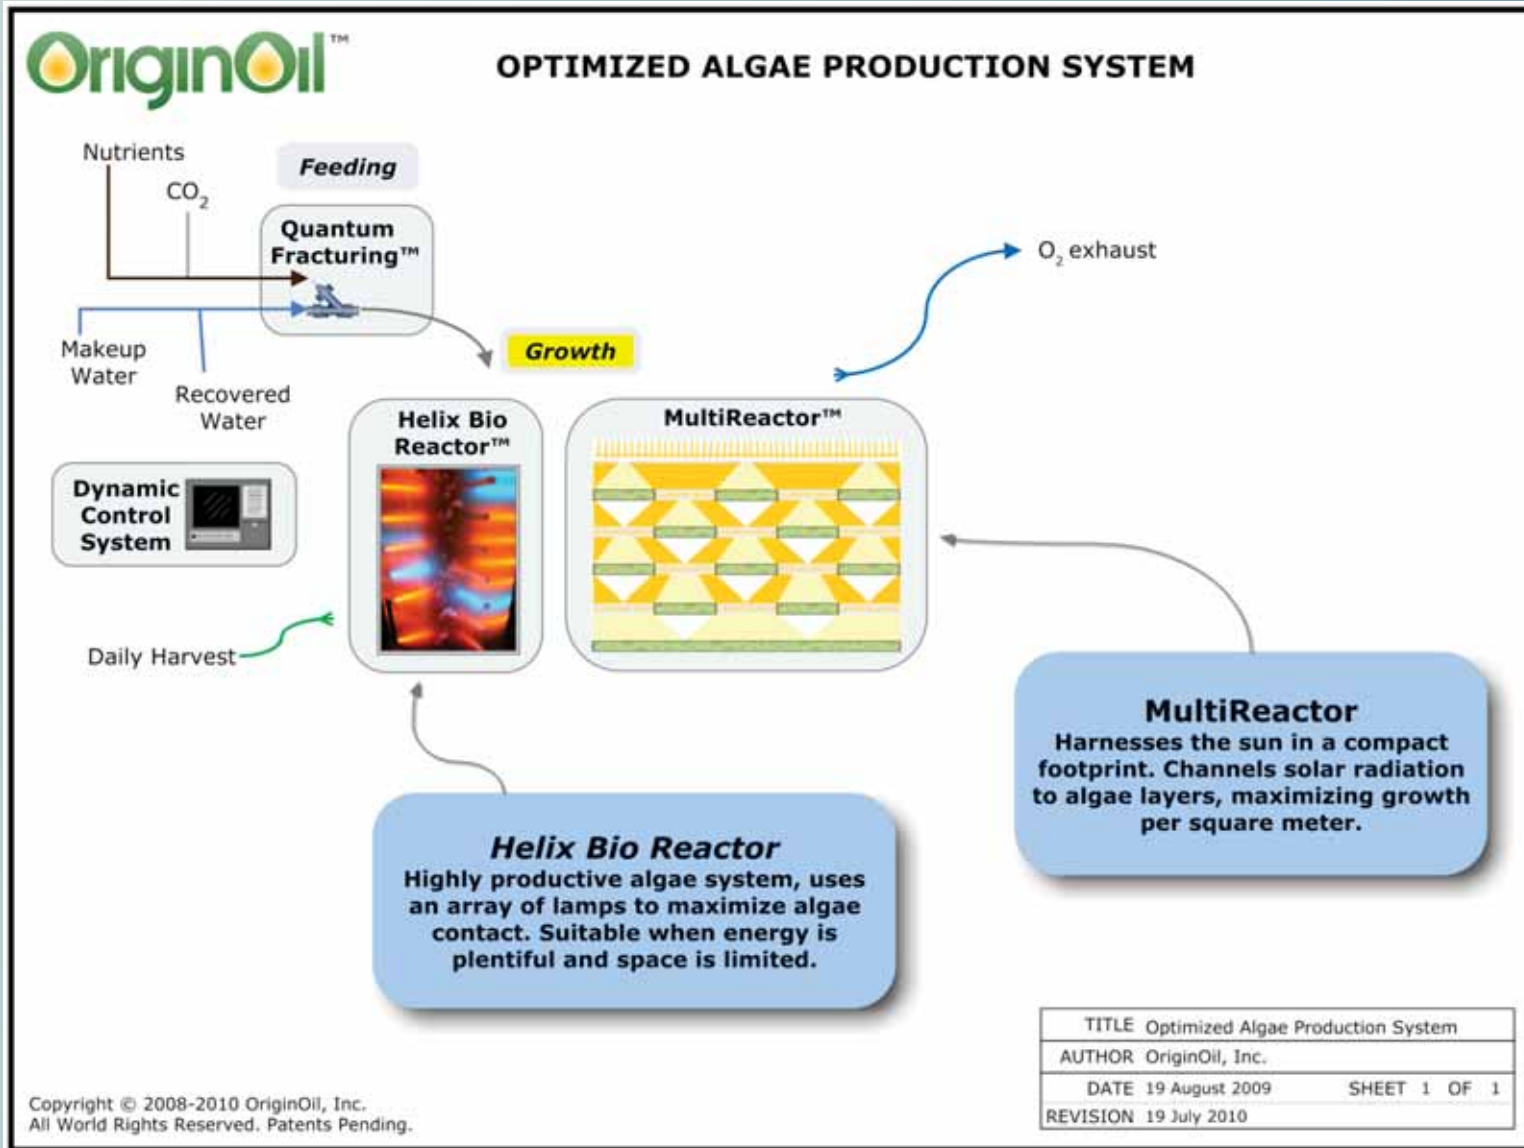

TITLE	Optimized Algae Production System

BENEFIT COMPARED TO EXISTING CAPABILITIES

KEY TECHNOLOGY INNOVATIONS

2C Biomass Energy Recovery Optimization

- Quantum Fracturing
 - Optimized nutrient delivery
 - Minimal disruption to culture

KEY TECHNOLOGY INNOVATIONS

2C Biomass Energy Recovery Optimization

- Optimized Light Delivery
 - Multiple growth layers
 - Small footprint
 - Low energy
 - Energy-efficient lights
 - Frequency-tuned lights
 - Optimum light absorption for efficient photosynthesis
 - Optimum flashing intervals

KEY TECHNOLOGY INNOVATIONS

2C Biomass Energy Recovery Optimization

- Lipid Extraction Challenge
 - Algae grow suspended in large volumes of water
 - Need cost-effective and energy-efficient dewatering
 - Must separate lipid from biomass efficiently
 - Need to recycle nutrients and water – conserve resources

KEY TECHNOLOGY INNOVATIONS

2C Biomass Energy Recovery Optimization

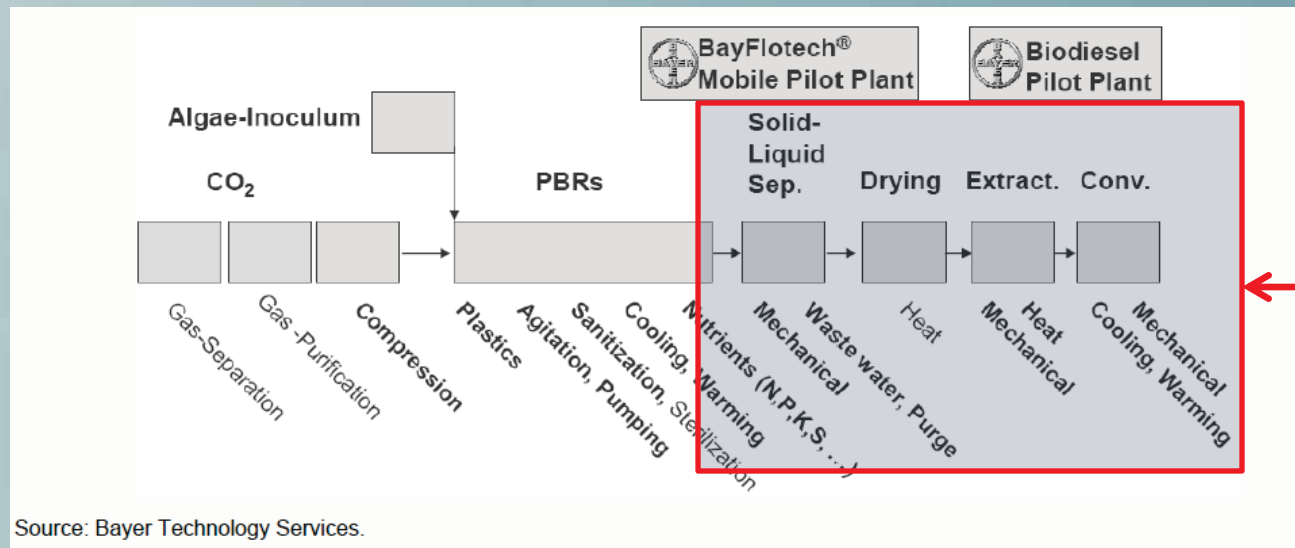

- Current Technology
 - Dewatering (<10% moisture)
 - Filtration
 - Centrifugation
 - Spray Drying
 - Lipid Extraction
 - Mechanical (pressing/extrusion)
 - Chemical (solvent extraction)

KEY TECHNOLOGY INNOVATIONS

2C Biomass Energy Recovery Optimization

- Conventional processing needs dewatering (<10% moisture) before lipid extraction
- High energy cost for dewatering!

KEY TECHNOLOGY INNOVATIONS

2C Biomass Energy Recovery Optimization

KEY TECHNOLOGY INNOVATIONS

2C Biomass Energy Recovery Optimization

- SSE Process Advantages
 - Obviates need for dewatering before lipid extraction
 - Requires approximately 10 times less energy than conventional process
 - Enables recycle of nutrients and water – resources conserved!

PROPOSED PATH FORWARD

Similar to  rather than 

- ❑ Like the giants of crude oil, the first-wave of algae oil companies have invested hundreds of millions of dollars in infrastructural build-out, vertical production, and head-to-head competition.
- ❑ OriginOil, on the other hand, is a pure *technology* company – competing with few while looking to partner with many.

Similar to  rather than 

- ❑ OriginOil's mission is to design and continually adapt the world's dominant technological platform for algae oil production.
- ❑ The Company will commercialize its technology through an integrated system of global partners, including:
 - ❑ Original Equipment Manufacturers (OEMs)
 - ❑ Country and Regional Partners
 - ❑ Device and Component Manufacturers
 - ❑ Service and Maintenance Providers
 - ❑ Customized Application Developers

Similar to  rather than 

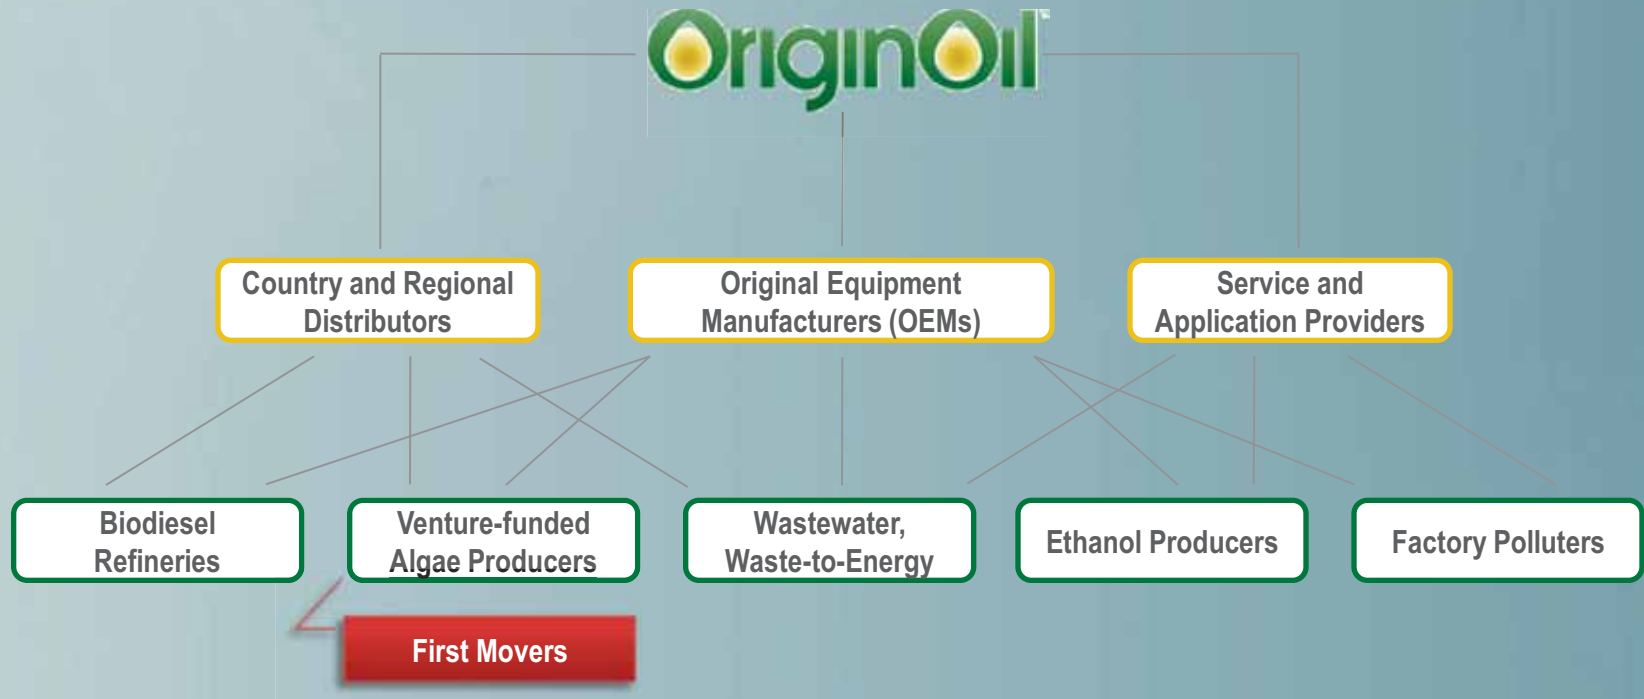

OriginOil's distributed partnership model offers a host of potential advantages, including:

- ❑ Limited Capital Requirements
- ❑ Clean balance sheet and minimal leverage requirements
- ❑ Streamlined operational focus on R&D, marketing, and “first mover” product line evolution
- ❑ Scalable model for regional and global markets
- ❑ Diversified revenue streams

Similar to  rather than 

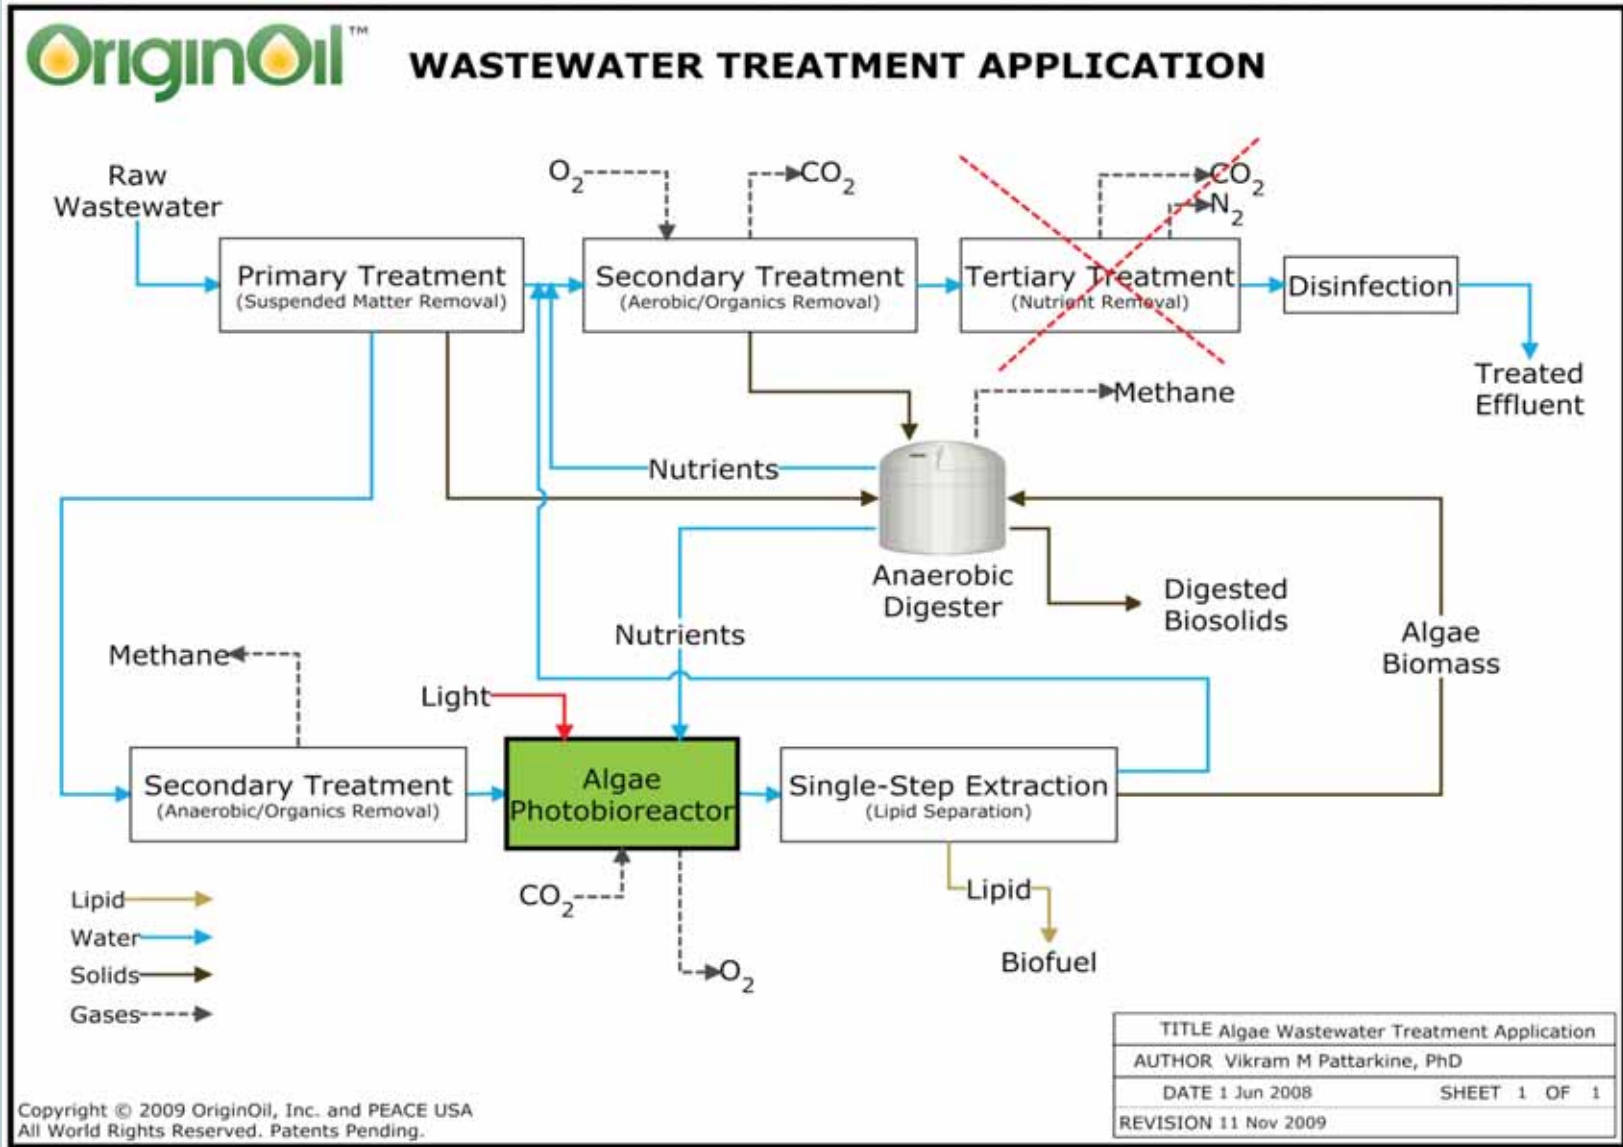

2C Biomass Energy Recovery Optimization

Wastewater Treatment Application

2C Biomass Energy Recovery Optimization

APPENDIX: PROCESS CALCULATIONS

Process Calculations

2C Biomass Energy Recovery Optimization

- How much land?
- How much water?
- Let's do the calculations...

How much land and water?

- Assumptions:
- Algae biomass concentration = 0.25 kg/m^3 (g/L)
- Lipid content = 30%
- Lipid density = 920 kg/m^3
- Depth of pond = 0.5 m
- Harvesting rate = 25%

How much land and water?

- Calculations for 10000 L/d of algae oil:
- $10,000 \text{ L/d} = 10 \text{ m}^3/\text{d} = 2,642 \text{ gal/d} = 63 \text{ barrels/d}$
- Therefore, algae biomass required =
- $10 \text{ m}^3/\text{d} \times 920 \text{ kg/m}^3 \times (100 \text{ g biomass} / 30 \text{ g lipid})$
- $= 30,667 \text{ kg/d} = 30.7 \text{ T/d}$

How much land and water?

- To harvest 25% biomass every day...
- Must maintain $30.7 \text{ T/d} / 0.25 = 123 \text{ T}$ of biomass in the system

How much land and water?

- How much water?
- $(123 \text{ T} \times 1000 \text{ kg/T}) / (0.25 \text{ kg/m}^3)$
- = 490,000 m³ of water = 490 ML = 129 MG

How much land and water?

2C Biomass Energy Recovery Optimization

- How large a footprint?
- 490,000 m³ of water / 0.5 m depth
- = 980,000 m²
- = 98 ha
- = 244 ac
- Biomass productivity = (30,667 kg/d) / (980,000 m²)
- = 0.031 kg/m²/d = 31 g/m²/d

How much land and water?

2C Biomass Energy Recovery Optimization
